Durham College

CYSC 1101: Cybersecurity Careers and Digital Portfolio

Kristen Macdonald

November 28, 2025

Question 1

The event for this reflection is the guest speaker event for the cybersecurity careers course. The speaker was Dr. Kayla Murphy, the director of Indigenous Initiatives at the First Peoples Indigenous Centre at Durham College. The overall topic for the presentation of this speaker was indigenous experience with the technological world.

Question 2

The tools and technologies discussed in this presentation are internet, cellular, and modern devices used in remote and isolated communities. SSi Micro is a mobile service that runs over the 4G (LTE) and 2G network of Qiniq, a telecommunications company, across many Nunavut communities. Ice Wireless is also a provider for northern cellular coverage. Tamarmik Nunaliit is a network developed by Northwestel, a north Canadian telecommunications company, that uses satellite technology providing high-speed internet or LTE wireless connection. Starlink was mentioned for connection with low earth orbit satellites.

Communities often rely on connection services that are limited in speed and reliability, such as satellites, microwave relay, or aging copper telephone lines. Similarly, fibre-optic cables were mentioned for an expensive connection solution for remote communities. Implementation of undersea fibre cables were announced in early 2025 for four Nunavut communities Iqaluit, Kinngait, Coral Harbour, and Kimmirut.

To follow with internet and connectivity technologies, internet service providers, and telecommunication services, we have platforms for culture and language. Language-learning apps and multimedia storytelling, such as FirstVoices, help communities learn indigenous languages and traditions.

Question 3

This presentation helps in my career goals of being successful with a cybersecurity career because it provides coverage on data sovereignty, digital inequity, and unique digital challenges. Knowledge about cyber policies, privacy, and ethical data management are important for cybersecurity students. Cybersecurity professionals who understand that digital inequity exists are in demand. Lastly, cybersecurity students informed and aware about environments where cybersecurity threats are high in risk helps me be a stronger candidate.

This presentation makes me think differently about my career goals because creating my cybersecurity career is truly not as much about the technical skills as I originally thought. After thoroughly going through this presentation, I better understand digital inclusion, ethical data practices, and cultural awareness.
