Part 1

Step 1

CREATE A NEW CASE

1. **Case Name:** The name of this investigation. It can contain only letters, numbers, and symbols.

2. **Description:** An optional, one line description of this case.

3. **Investigator Names:** The optional names (with no spaces) of the investigators for this case.

a.		b.	
c.		d.	
e.		f.	
g.		h.	
i.		j.	

Step 2

Case: GCFI-datacarve-FAT

ADD A NEW HOST

1. **Host Name:** The name of the computer being investigated. It can contain only letters, numbers, and symbols.

2. **Description:** An optional one-line description or note about this computer.

3. **Time zone:** An optional timezone value (i.e. EST5EDT). If not given, it defaults to the local setting. A list of time zones can be found in the help files.

4. **Timeskew Adjustment:** An optional value to describe how many seconds this computer's clock was out of sync. For example, if the computer was 10 seconds fast, then enter -10 to compensate.

5. **Path of Alert Hash Database:** An optional hash database of known bad files.

6. **Path of Ignore Hash Database:** An optional hash database of known good files.

Step 3

Case: GCFI-datacarve-FAT
Host: host1

ADD A NEW IMAGE

1. Location
Enter the full path (starting with /) to the image file.
If the image is split (either raw or EnCase), then enter '*' for the extension.

2. Type
Please select if this image file is for a disk or a single partition.

☐ Disk ☒ Partition

3. Import Method
To analyze the image file, it must be located in the evidence locker. It can be imported from its current location using a symbolic link, by copying it, or by moving it. Note that if a system failure occurs during the move, then the image could become corrupt.

☐ Symlink ☒ Copy ☐ Move

Step 4

Case: GCFI-datacarve-FAT
Host: host1

Select a volume to analyze or add a new image file.

CASE GALLERY
HOST GALLERY
HOST MANAGER

mount	name	fs type	
☐ disk	GCFI-datacarve-FAT.dd-disk	raw	details
☒ C:/	GCFIi-datacarve-FAT.dd-0-0	fat16	details

Step 5

```
MD5 Values for files in C:/ (GCFIi-datacarve-FAT.dd-0-0)

d41d8cd98f00b204e9800998ecf8427e - FAT16 (Volume Label Entry)
```

Step 6

Step 7

Step 8

The file analysis function allows you to view file and directory contents, add notes, and generate an MD5 list of files. You can enter the specific location in the directory that you want to view, search for specific file names with regex support, delete all the files, and expand sub-directories.

The keyword search function allows you to search an image for a given string and is mostly used for deleted content to save time searching. Autopsy will report the location of the image if a string is found in that file.

The file category type function helps you sort files based on the file type and exclude known files. With the help from the sorter tool from The Sleuth Kit that performs sorting, you can sort files by file type and validate extensions. With sorting, you have the option to save the output or save the unknown file types.

The image details function is used to view general details of an image which its content can vary depending on the file system type. Some types of file systems are FFS, FAT, and NTFS.

The metadata function helps investigators to see metadata which provides information about information of a file which can vary depending on the file system.

The data unit function can help investigators see the contents of an individual data unit which are areas on the disk used to store data. This mode is especially useful when recovering and analyzing deleted data.
